Abstract

A desiccant seal (10) for a hermetically-sealed container used to store moisture-sensitive goods, preferably comprises a stopper, lid or cap (most preferably a twist cap) used to protect the goods against atmospheric moisture. The seal has a desiccant cell comprising hygroscopic material, that lies inside the container when it is sealed. A dimensionally stable moulded body (34) comprising a mixture of powdered, granular or crystalline desiccant and a cured or crosslinked binder is attached to the seal to act as the cell. The preparation of the cells is also claimed.
